

Our games are called Chilling Echoes. They are made with Python.

Players can choose two kinds of games. One is 3D and another one is 2D. The goal of both games is to escape from the maze. In 2D games, players have to escape from the basement on a snowy day. But it's not like other traditional chasing games, players have the opportunity to fight back. They can either use guns to shoot at monsters or use the flashlight to stun monsters. For 3D games, those smiling faces will chase players in an indoor space. To enter into the next level, players must find a yellow exit. In the 3D game, there are various smiling faces, players need to take different strategies while facing them.

Dane did a lot of coding for his 3d game, and so did Harry. Both games featured very different dynamics, like music, different graphics, and different controls. In full detail, Dane's game is about a player who opens the first page to see the shop, instructions, quit, and start button. In the Shop, there are special items that help the player advance onwards toward the maze without getting killed by the smiles. The player starts in a subway, entering it, then he suddenly appears in a maze, having the smiles chase him. The red smile appears in the game, which the player has to stare at the red smile to

make it disappear. Then there's the blue smile, which the player clicks on to also disappear. And the white smile just chases the player, and the player can't do anything but run. once the player finishes one level, the walls of each sub level changes color, and there's total of 12 sub levels, with the final bonus level being a boss, and the player then finishes a coin round, and receives more tokens. We used a lot of ai for this coding, but me and Harry's comments to each other made the game better and more creative. Dane and Harry had struggled with communicating with each other on our games, and we ultimately decided to do two separate games. But we managed to work together on my game, and Harry was the person who helped with lots of the poster, and his coding game which Dane used some of the valuable stuff to put in my game, which we both decided to use. Dane made his own game with the help of Gemini, and it worked perfectly. Dane and Harry never had any experience with coding, but they learned off the bat, and managed to make their own games, and chose Dane's game to be the chosen game for the project. Harry and Dane were mostly working on the project during project time, but we did not do any extra time outside to fix or edit more of the game.
